

Fisheries Survey

To enhance or sustain the health of your lake or pond and its fishing!

Fish surveys are designed to analyze the basic parameters of a fishery, identify possible problems, and provide recommendations for improvements. Your fish survey report will include information on water quality, predator/prey balance, and species composition.

Aquatic Control® offers three types of surveys:

Basic Fish Survey

- Water quality analysis includes: pH, alkalinity, hardness, nitrate-nitrogen, orthophosphate, oxygen/temperature profile, and water clarity
- Brief electrofishing survey (maximum 1 hour)
- Length and weight analysis of selected species
- Data summarized in table form
- Two page report with recommendations

Standard Fish Survey

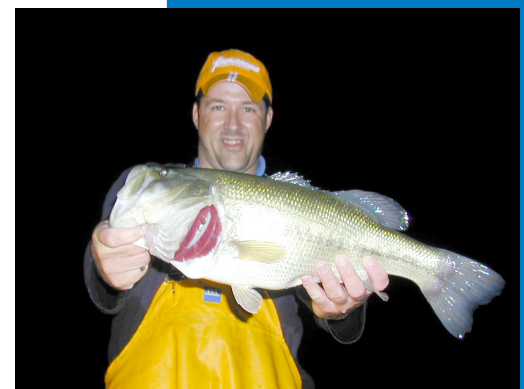

- Includes above parameters plus:
- Electrofishing as needed for adequate sample
- Length & Weight analysis of important species in fish community
- Data summarized and presented in table and graph form
- A complete report describing and interpreting findings with recommendations

Comprehensive Fish Survey

- Includes above parameters plus:
- Length, Weight & Age analysis of important species in fish community

Options

- SCUBA surveys, bottom sampling, plant and algae sampling, detailed water quality analysis and fish tissue analysis
