

## Lake Life Guard

*To improve water quality and the beauty of your lake!*

Diffused air systems will improve water quality, fish habitat, and help prevent winter freeze-over. Diffused air systems are the best choice for deeper bodies of water or where an unobtrusive aerator is preferable. No mechanical parts of a diffused air system are in direct contact with the water so it can be used year round. Diffused air systems are also easy to install, easier to maintain, and less costly to run than other aeration options.

### Improved Water Quality

- Keeps water in constant motion and prevents stagnation
- Reduces “muck” and nutrient buildup
- Can be used to aerate year round
- Aids in reduced nutrient cycling
- Eliminates thermal stratification and turnover

### Fish Habitat Improvement

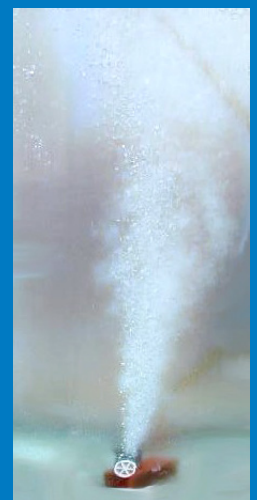

- Increases oxygen concentration in water for fish
- Increases available habitat by improving oxygen levels top to bottom
- Helps prevent summer and winter fish kills
- Increases production of fish food organisms

### Reduced Winter Freeze-over

- Warmer, deeper water brought to surface via air bubbles
- Bubbling action keeps an “open space” from freezing
- Provides open water for waterfowl in winter

### Installation, Operation, and Maintenance

- Can be installed by two people with a boat
- Several aeration packages available to fit different budgets and needs
- Greater energy efficiency than other aeration options
- Simple design needs less maintenance and provides greater durability
- Aquatic Control® provides installation and service upon request
